Q: How do I change the virtual COM port mapping on the fly without using the VxComm Utility?

A: The VxComm Driver for NT and 2K/XP uses the VxComCfg.DLL to export functions and import configuration from a given file.

An article – **VxComCfg_vx.x.txt** to describe the VxComCfg.DLL, has been installed into the " **C:\ICPDAS\VxComm W7\VxComCfg** " directory after the driver setup. VB examples and other materials can be found besides in the same location. Please refer to them for further information.
